

Ometria Senior Frontend Task

For this exercise, you'll be using the publicly available Star Wars API (<https://swapi.dev/documentation>) and the endpoint that allows you to query for Star Wars characters. (/people endpoint: <https://swapi.dev/>).

Task

Your task is to build a web page that displays Star War characters in a table with error output and pagination. It should also allow the user to search for a specific character by name (powered by the API's search parameter). This is the end goal but you're obviously encouraged to make the UX as compelling as possible!

Please use any modern framework/library (React, Vue.JS, Angular) or vanilla JavaScript along with any other libraries you may need to implement a solution for this task. (Of course, if you just happen to find whatever component that does all of this for you, that will give us great insight on your npm-searching skills, but not so much into your coding...)

Please submit your working solution with a link to a git repository.
